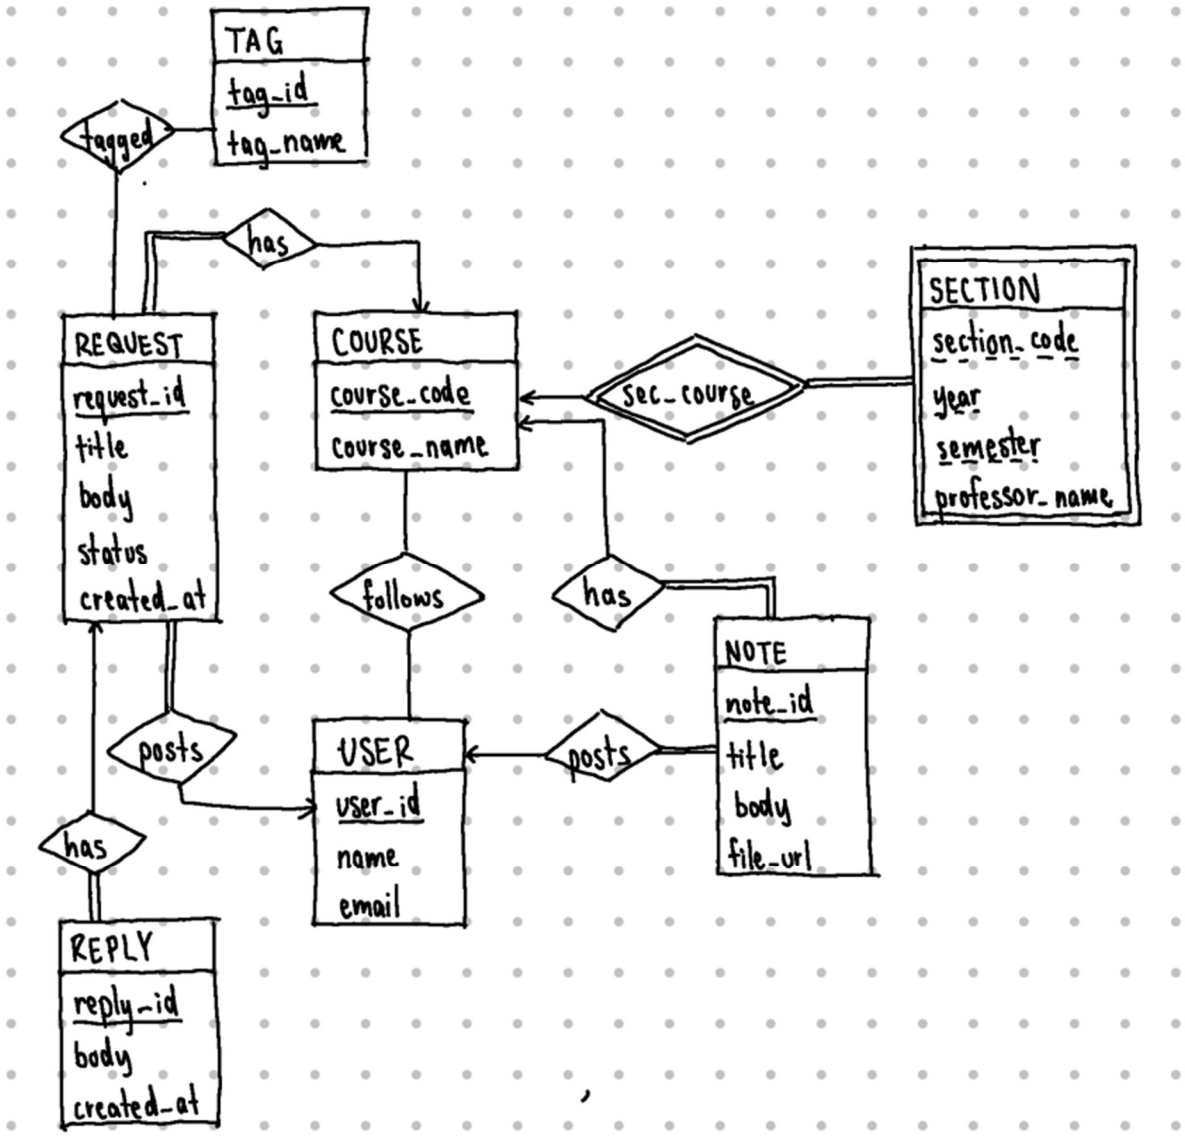
Database Design – NoteHub

This ER diagram represents the database structure for NoteHub.



[description of entities and relationships follows]

Entities	Relationships
User: Represents a user of the system who can create notes, requests, and replies. Course: Represents an academic course that notes and requests are associated with. Note: Represents study material shared by users, including a title, body, and optional file attachment. Request: Represents a user's request for notes or information related to a course. Reply: Represents a response to a request, allowing users to communicate and share information. Tag: Represents categories used to label and organize notes. Section: Represents a specific offering of a course, identified by semester and year.	A user can create multiple notes, requests, and replies, but each note, request, and reply is associated with exactly one user. A course can have multiple notes and requests, but each note and request belongs to one course. A request can have multiple replies, but each reply belongs to one request. Notes and tags have a many-to-many relationship, allowing notes to be associated with multiple tags and tags to be used for multiple notes. A course can have multiple sections, but each section belongs to one course. Users can follow multiple courses, and each course can be followed by multiple users.
